Outcome variable

Predictor variable(s)

Panel setting

Random effects option

n = # of groups/panels, T = # years, N = total # of observations

Interpretation of the coefficients is tricky since they include both the within-entity and between-entity effects. In the case of TSCS data represents the average effect of X over Y when X changes across time and between countries by one unit.

Pr(>|t|)= Two-tail p-values test the hypothesis that each coefficient is different from 0. To reject this, the p-value has to be lower than 0.05 (95%, you could choose also an alpha of 0.10), if this is the case then you can say that the variable has a significant influence on your dependent variable (y)

If this number is < 0.05 then your model is ok. This is a test (F) to see whether all the coefficients in the model are different than zero.

# ***FIXED OR RANDOM?***

To decide between fixed or random effects you can run a Hausman test where the null hypothesis is that the preferred model is random effects vs. the alternative the fixed effects (see Green, 2008, chapter 9). It basically tests whether the unique errors ( $u_i$ ) are correlated with the regressors, the null hypothesis is they are not.

Run a fixed effects model and save the estimates, then run a random model and save the estimates, then perform the test. If the p-value is significant (for example  $<0.05$ ) then use fixed effects, if not use random effects.

```
> phtest(fixed, random)
```

```
Hausman Test
```

```
data: y ~ x1  
chisq = 3.674, df = 1, p-value = 0.05527  
alternative hypothesis: one model is inconsistent
```

If this number is  $< 0.05$  then use fixed effects

```

The LM test helps you decide between a random effects regression and a simple OLS regression.

The null hypothesis in the LM test is that variances across entities is zero. This is, no significant difference across units (i.e. no panel effect). (<http://dss.princeton.edu/training/Panel101.pdf>)

```
> # Breusch-Pagan Lagrange Multiplier for random effects. Null is no panel effect (i.e. OLS better).
```

```
> plmtest(pool, type=c("bp"))
```

Lagrange Multiplier Test - (Breusch-Pagan)

```
data: v ~ x1
```

```
. df = 1, p-value = 0.1023
H0: no significant effects
```

led to reject the null and conclude that random effects is not appropriate. This is, no significant differences across countries, therefore you can run a simple OLS regression.

Fall 2010

# Testing for cross-sectional dependence/contemporaneous correlation: using Breusch-Pagan LM test of independence and Pasaran CD test

According to Baltagi, cross-sectional dependence is a problem in macro panels with long time series. This is not much of a problem in micro panels (few years and large number of cases).

The null hypothesis in the B-P/LM and Pasaran CD tests of independence is that residuals across entities are not correlated. B-P/LM and Pasaran CD (cross-sectional dependence) tests are used to test whether the residuals are correlated across entities\*. Cross-sectional dependence can lead to bias in tests results (also called contemporaneous correlation).

```
> fixed <- plm(y ~ x1, data=Panel, index=c("country", "year"), model="within")
```

```
> pcdtest(fixed, test = c("lm"))
```

```
Breusch-Pagan LM test for cross-sectional dependence in panels
```

```
data: formula  
chisq = 28.9143, df = 21, p-value = 0.1161  
alternative hypothesis: cross-sectional dependence
```

```
> pcdtest(fixed, test = c("cd"))
```

```
Pesaran CD test for cross-sectional dependence in panels
```

```
data: formula  
z = 1.1554, p-value = 0.2479  
alternative hypothesis: cross-sectional dependence
```

No cross-sectional dependence

Robust Standard Errors for Panel Regressions with Cross-Sectional Dependence",

Fall 2010 [/bocode/x/xtsc paper.pdf](http://bocode.x/xtsc paper.pdf)

# Testing for serial correlation

Serial correlation tests apply to macro panels with long time series. Not a problem in micro panels (with very few years). The null is that there is not serial correlation.

```
> pbgtest(fixed)
Loading required package: lmtest
```

```
Breusch-Godfrey/Wooldridge test for serial correlation in panel models
```

```
data: y ~ x1
chisq = 14.1367, df = 10, p-value = 0.1668
alternative hypothesis: serial correlation in idiosyncratic errors
```

No serial correlation

# Testing for unit roots/stationarity

The Dickey-Fuller test to check for stochastic trends. The null hypothesis is that the series has a unit root (i.e. non-stationary). If unit root is present you can take the first difference of the variable.

```
> Panel.set <- plm.data(Panel, index = c("country", "year"))  
  
> library(tseries)  
  
> adf.test(Panel.set$y, k=2)
```

Augmented Dickey-Fuller Test

```
data: Panel.set$y  
Dickey-Fuller = -3.9051, Lag order = 2, p-value = 0.01910  
alternative hypothesis: stationary
```

If p-value < 0.05 then no unit roots present.

# Testing for heteroskedasticity

The null hypothesis for the Breusch-Pagan test is homoskedasticity.

```
> library(lmtest)
> bptest(y ~ x1 + factor(country), data = Panel, studentize=F)
```

```
Breusch-Pagan test
```

```
data: y ~ x1 + factor(country)
BP = 14.6064, df = 7, p-value = 0.04139
```

Presence of heteroskedasticity

If heteroskedasticity is detected you can use robust covariance matrix to account for it. See the following pages.

# Controlling for heteroskedasticity: Robust covariance matrix estimation (Sandwich estimator)

The `--vcovHC-` function estimates three heteroskedasticity-consistent covariance estimators:

- "white1" - for general heteroskedasticity but no serial correlation. Recommended for random effects.
- "white2" - is "white1" restricted to a common variance within groups. Recommended for random effects.
- "arellano" - both heteroskedasticity and serial correlation. Recommended for fixed effects.

The following options apply\*:

- HC0 - heteroskedasticity consistent. The default.
- HC1, HC2, HC3 - Recommended for small samples. HC3 gives less weight to influential observations.
- HC4 - small samples with influential observations
- HAC - heteroskedasticity and autocorrelation consistent (type `?vcovHAC` for more details)

See the following pages for examples

For more details see:

[project.org/web/packages/plm/vignettes/plm.pdf](http://project.org/web/packages/plm/vignettes/plm.pdf)

[project.org/web/packages/sandwich/vignettes/sandwich.pdf](http://project.org/web/packages/sandwich/vignettes/sandwich.pdf) (see page 4)
